

Ai Gateway™

Connecting to the National Networks
for seamless coordination across
the care continuum

HOW CAN Ai GATEWAY HELP YOU? //

Exchange real-time data regionally

Sharing clinical data such as discharge summaries with regional partners enhances the continuum of care and business relationships where it matters most.

Onboard you to the national networks

Ai Gateway enables organizations without the technical support or internal bandwidth to quickly connect to the national networks.

Query on Demand: Fetch and Push

Use the patient's discharge to trigger a query that fetches clinical documents and pushes to provider care management teams.

BENEFITS TO PARTICIPANTS //

Accountable Care Organizations (ACOs)

Discharge summaries from the national networks allow ACO care managers to reduce costs of care and improve patient outcomes by focusing on patients that require follow up care.

Patient Scenario: A 75-year old male patient has difficulty breathing and is transported to the hospital, where he is diagnosed with COPD and referred to a pulmonologist for follow-up. ENS notifies the patient's ACO of the encounter in real-time and the Ai Gateway delivers the hospital discharge summary to the ACO the next day.

Skilled Nursing Facilities (SNFs)

Receive clinical data for new patients automatically on admission and when patients are readmitted to the hospital, allowing better coordinated care.

Patient Scenario: An 85-year old female patient with CHF is discharged from the hospital to skilled nursing. ENS and Ai Gateway automatically query connected hospitals for relevant clinical documentation and deliver it to the SNF. If the patient is readmitted to the hospital, ENS can notify the SNF in real-time and the Ai Gateway allows the two facilities to exchange records.

Ambulatory Care Organizations

The Ai Gateway allows PCPs to pull inpatient documents from facilities the patient has visited, allowing the provider to have up-to-date clinical information for the current visit.

Patient Scenario: A 36-year old high-risk pregnant female visits her obstetrician for an initial appointment. Ai Gateway provides the obstetrician the ability to query for prior delivery information from connected hospitals, allowing better insight into pregnancy planning.
